
APPARATUS AND METHOD FOR FABRICATING CHIRAL FIBER GRATINGS

ABSTRACT

An apparatus and method for fabricating fiber gratings from optical fibers
5 by imposing constant or variable chiral refractive index modulation along an
optical fiber. The refractive index modulation may be of single helix symmetry to
produce a fiber grating enabling different propagation speed of signals with the
same handedness as the structure with respect to signals with opposite
handedness as the structure at a wavelength substantially equal to the pitch of
10 the single helix, or of double helix symmetry to produce a chiral fiber Bragg
grating. In several embodiments of the present invention the refractive index
modulation is imposed by twisting and moving a specially prepared optical fiber
through a heater that heats a small region of the fiber to a temperature sufficient
to allow the fiber to twist in that region as it moves through the heater.
15 Alternately, a normal optical fiber may specially prepared for use with the
apparatus of the present invention at a pre-process stage prior to twisting and
heating. In other embodiments of the inventive apparatus, the refractive index
modulation is imposed by cutting one or more helical groove patterns into a
normal optical fiber, or by wrapping a normal fiber with one or more elongated
20 dielectric fibers of a smaller diameter than the optical fiber in one or more helical
patterns. Advantageously, the fabrication of the chiral fiber grating may be
monitored and the fabrication parameters automatically adjusted to ensure that
the chiral fiber grating meets desired requirements.
